## 1 Installing the FARAWAY package

For using the **FARAWAY** package in our R console we need to install it first . **Firstly make sure you are connected to the Internet** . Then to install it use the following command ( if not already installed ) :-

- `> install.packages("faraway")`

Now the following 3 things may happen :-

- Package gets installed without any error
- A list of websites ( where R packages are stored ) is displayed

In that case , pick the first one and press ENTER . The package shall then be installed .

- An error message pops up saying some library folder is not accessible

This usually happens when one is on a Windows machine and does not have administrator privileges . In this case , use the following command ( involving some accessible folder ) , for instance :-

- `> install.packages("faraway", lib="c:/users/abc")`

This shall install the package to the desired folder .

## 2 Using the **FARAWAY** package

Note that the **FARAWAY** package needs to be installed only once per computer and there is no need to do it everytime we need it( even after shutting down the machine ! ) . But everytime we start a R session and wish to use the **FARAWAY** package, we need to use the following command :-

- `> library(faraway)`

This loads the package and returning to the prompt we can start using it and all its available functions and Datasets !
